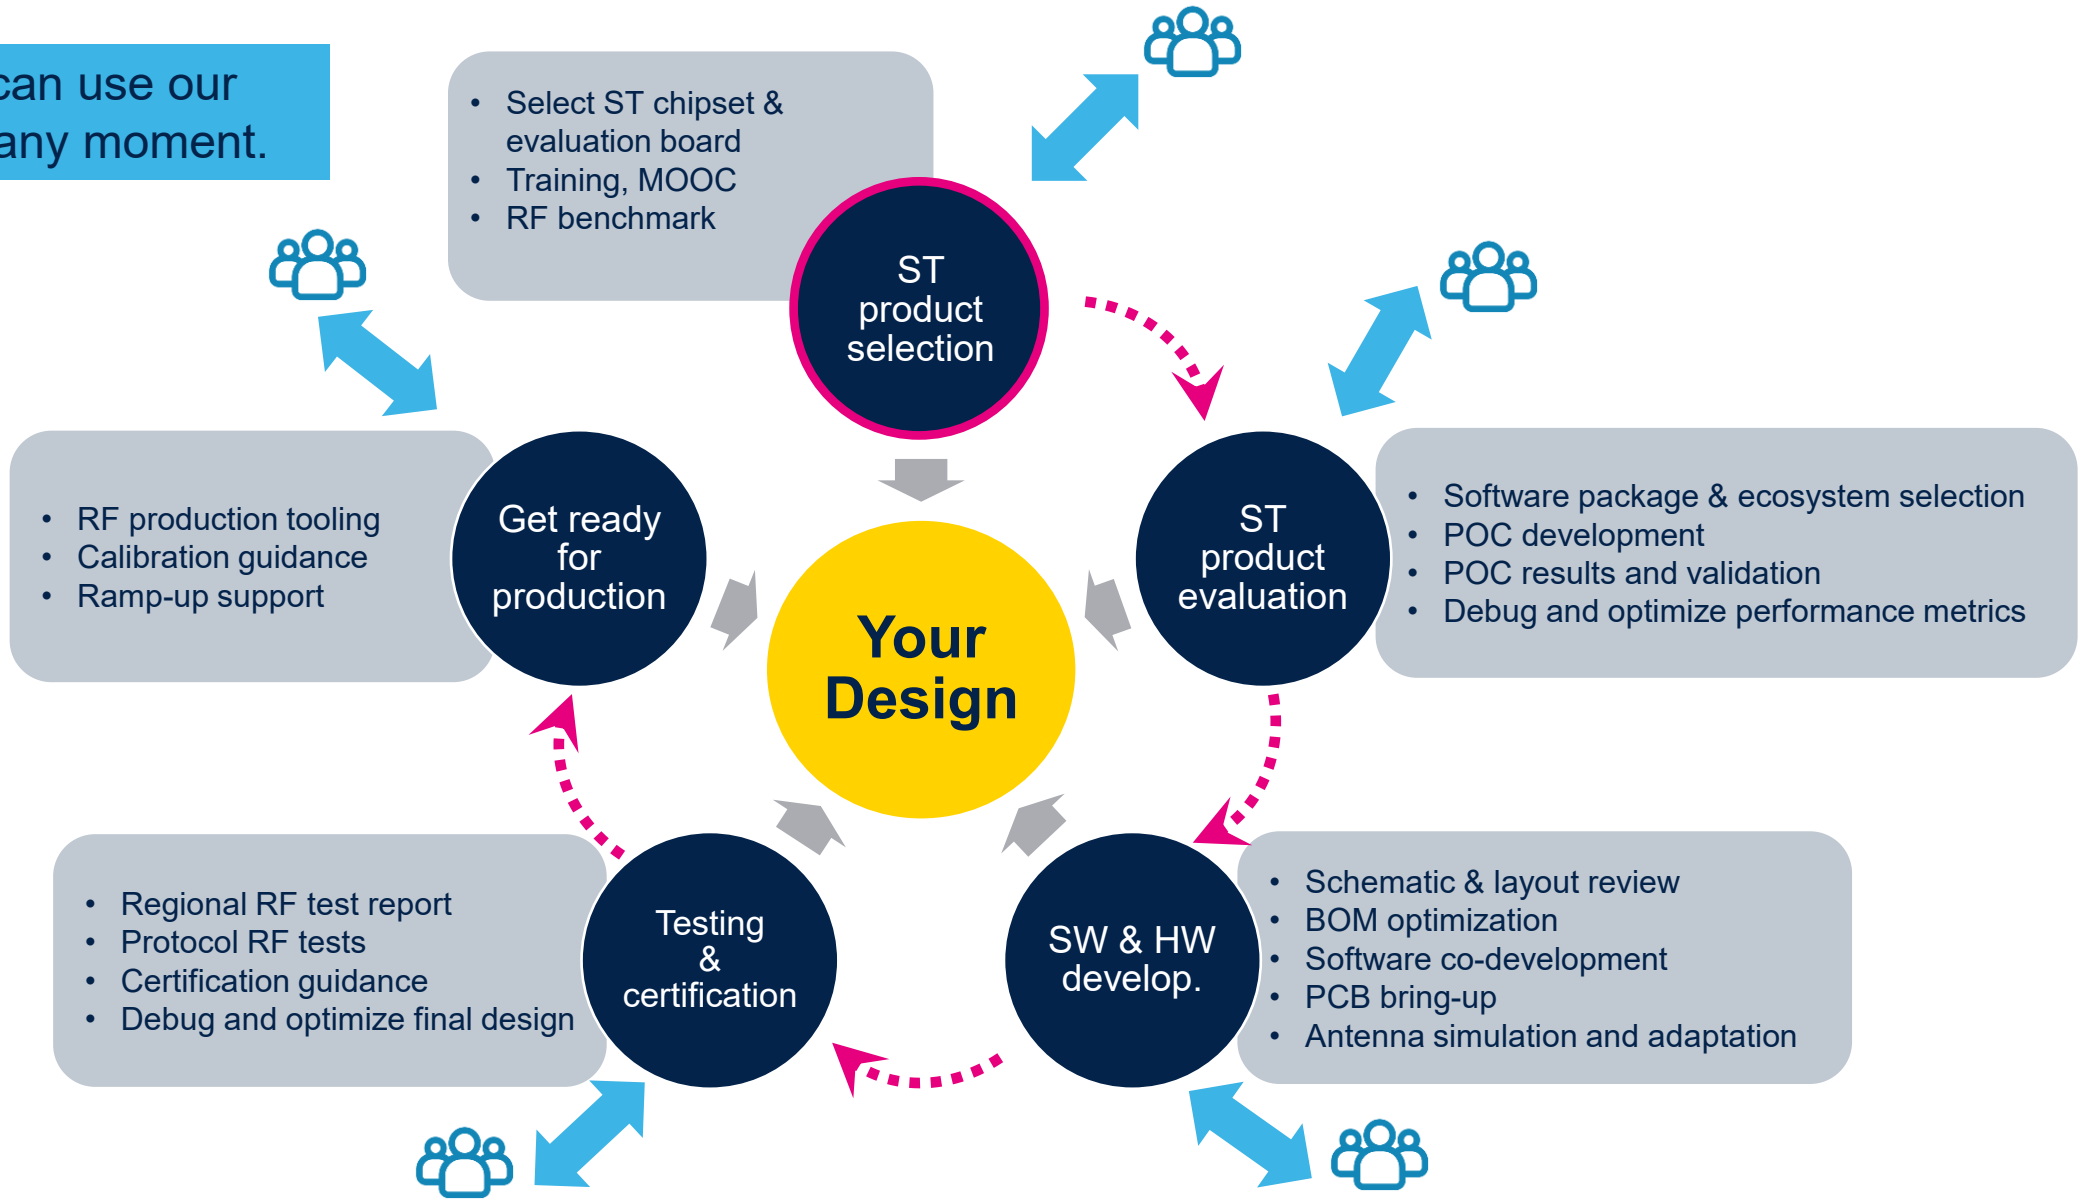
What’s next?

ST support your **wireless journey**
at each project development phase

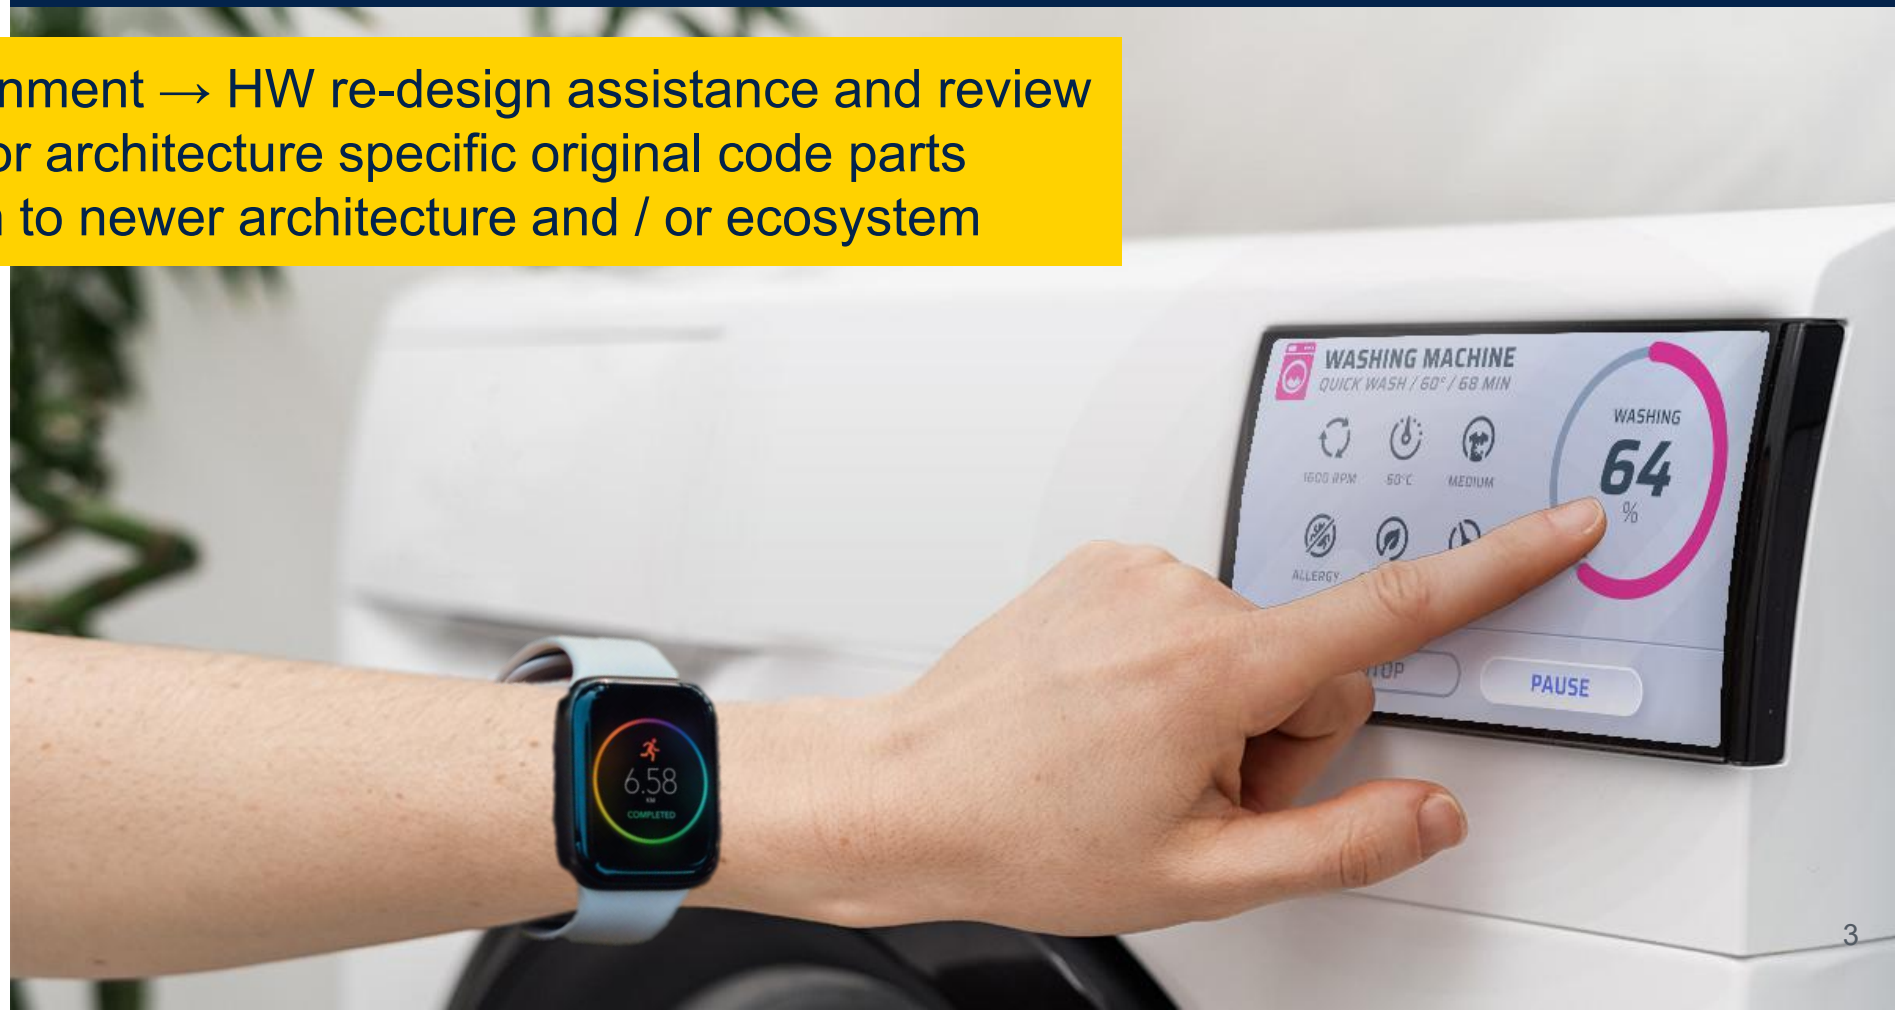
Customer can use our support at any moment.



Software Co-Development

Speed-up project by cooperation work!

- Peripheral / feature assignment → HW re-design assistance and review
- Porting of all MCU and / or architecture specific original code parts
- Assistance with migration to newer architecture and / or ecosystem



Time to market
Total BOM cost (including R&D cost)

Software Co-Development

I need to make a new design, but I do not have enough resources for the SW migration

The start of the journey might not be always the same.
It can be already a new product generation or simple redesign of an existing product.

Older / Other ST MCU

Other platform

Dual-chip → Single chip

HW

Functional prototype

3rd party ecosystem → Cube
(e.g. Zephyr,…)

→ Bare metal (LL), other RTOS,…
(e.g. even assembly code)

Wireless protocol stack migration

Peripherals and features porting
(porting the HAL or HW dependent code in general)

FW

New end-product features development

Optimization

Our knowledge and expertise is ready for your project!

- Assistance with application optimization
  - benefiting of our advanced expertise and architecture knowledge
  - e.g. speed, size, consumption, peripherals use,…

life.augmented

Optimization

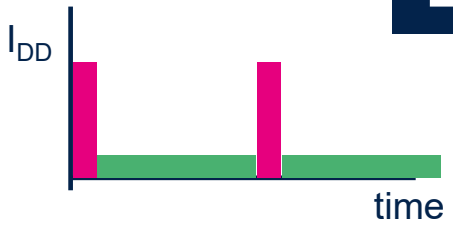
Time to market
Total BOM cost (including R&D cost)

I have issue with too high energy consumption…

I need to reduce the FLASH / RAM footprint…

Security

Code execution speed



Code size

Optimal Peripherals and features usage

DMA, memories,
interconnection matrix,
autonomous peripherals

Energy consumption

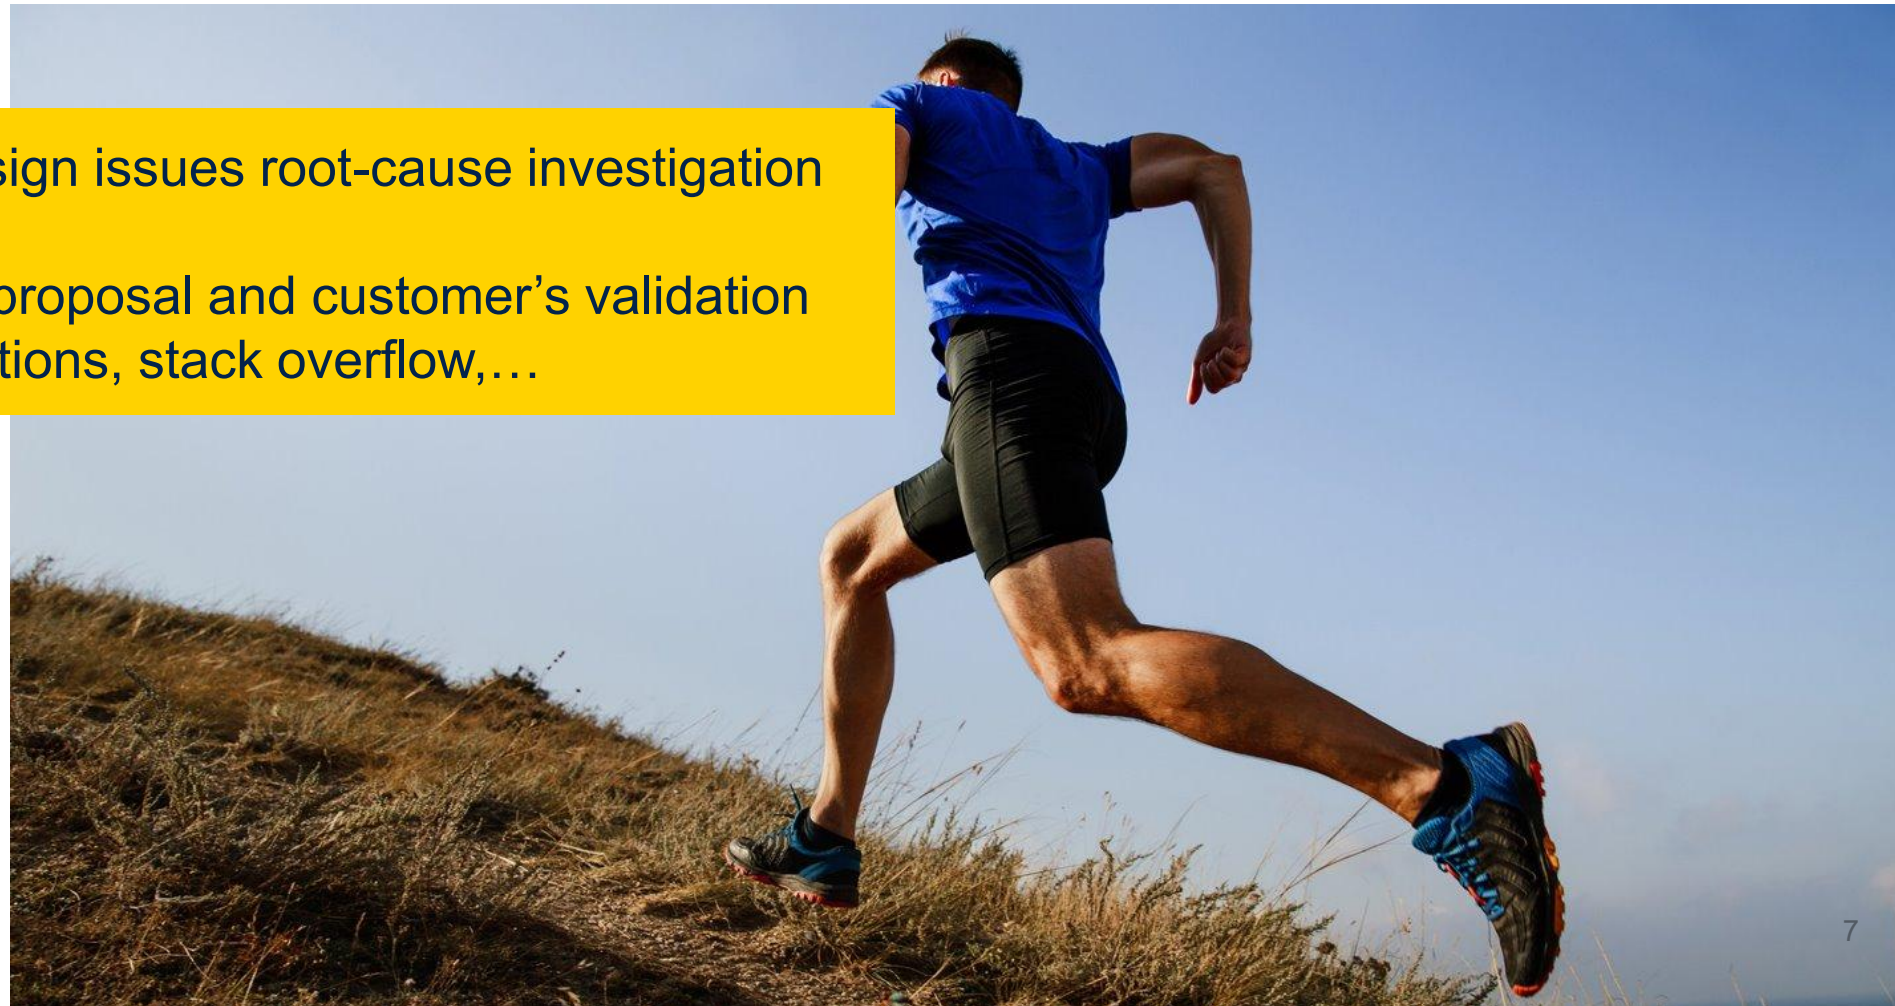
positive impact → to be **maximized**

negative impact → to be **minimized**

Advanced troubleshooting

Our experts are ready to go!

- Customer’s HW / SW design issues root-cause investigation
  - More complex issues
  - Ending with solution proposal and customer’s validation
  - e.g. EMC, race conditions, stack overflow,…



Time to market
Total BOM cost (including R&D cost)

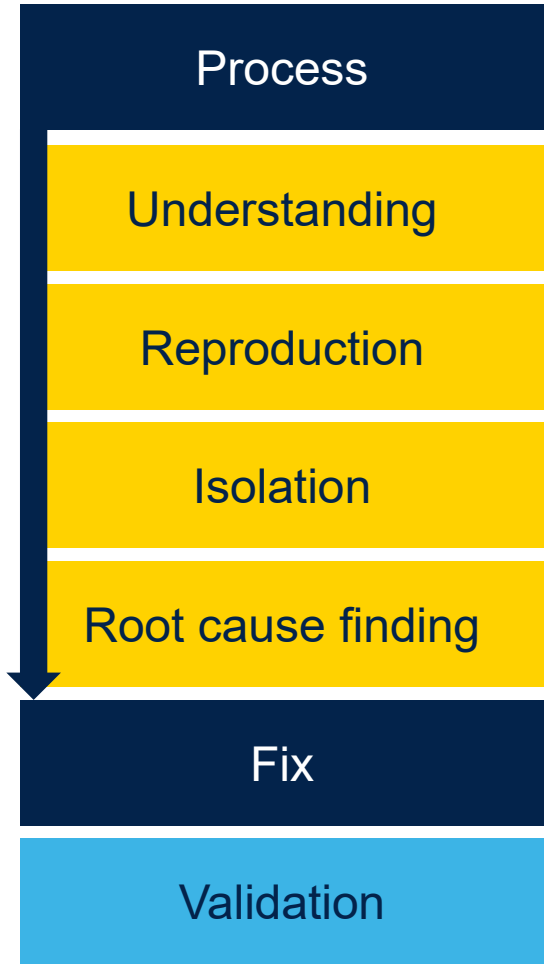
Advanced troubleshooting

“Something is wrong” with your MCU or SDK bricks

- Unexpected SW behavior (e.g. even visible at RF communication)
- Hard-faults, race conditions, peripherals and system blocks misuse
- HW malfunction or damage (e.g. even overconsumption at specific situation

- **Methods**
  - HW review
    - schematics, layout, PCB stack-up
  - SW review
  - Profiling and timing analysis
    - IO toggling, advanced tools (RTOS), additional logs
  - Air traces analysis
    - sniffer logs collection and analysis

- Working with customer’s HW
- Ready for on-site debug
- Priority always respect the severity



Certification

Our experts are ready to help!

- Sharing experience with certifications...
  - Regional
  - Protocol
- Providing guidance
- Exploring and adapting to news

CE (RED) | FCC | MIC | NCC | SRRC | KC | ISED | ANATEL and more...

Time to market
Total BOM cost (including R&D cost)

Certification

I need to pass certification...	Process guidance and hints
Test house is requesting some information, I do not know where to find them.	Paperwork assistance
I returned back from the test house and I will need to go again.	Troubleshooting

- Some issues still may reveal only in the test house (radiated tests)
- We can provide assistance even remotely during your visit of the test house
